Toronto, Canada

SUMMARY

Detail-oriented and mission-driven final year engineering student with strong foundations in test automation, agile development, and functional testing. Experienced in UI and backend test development using Java, Python, and modern automation frameworks. Adept at working cross-functionally in fast-paced environments, with a proven track record of improving testing coverage and delivery speed. Passionate about delivering high-quality software that benefits society.

EDUCATION

Bachelor of Applied Science: Electrical & Computer Engineering
University of Toronto, St George Campus, Toronto Canada

Sept 2019 – April 2025 (Expected)
CGPA: 3.31/4.00

- Minor: Artificial Intelligence | Business Certificate | Specializations: Software Systems, Controls & Communication

TECHNICAL SKILLS

Programming: C, C++, Python, Java, JavaScript, Assembly, Verilog

Testing & QA: Selenium, Playwright, TestNG, PyTest, Postman, REST API, JIRA, Locust

Automation Tools: Jenkins, Bitbucket, Git, New Relic

Dev Practices: Agile, TDD, Black Box, Regression Testing, Load Testing

DBMS & Operating Systems: PostgreSQL, SSMS, JQL, NRQL, Windows, Linux

Familiarity with: Algorithms & Data Structures, OS, Computer Networks, Deep Learning Models, Search Algorithms, Knowledge Representation & Reasoning, CSPs and Game Theory, Accounting & Finance

WORK EXPERIENCE

Software Developer in Test Intern (QA)
Genesys Cloud Services Corp (Canada)

May 2023 – August 2024
North York, Toronto, Canada

- Developed and executed automated and manual tests for UI and backend microservices in an Agile environment.
- Upgraded 9 Selenium-based test cases to Playwright with Java and TestNG, increasing test maintainability.
- Designed Python scripts and Excel macros to automate test reporting, boosting automation adoption by 65% and reducing processing time by 75%.
- Maintained CI pipelines using Jenkins; contributed to the QA automation framework and test coverage strategy.
- Collaborated cross-functionally with developers, PMs, and QA peers to ensure product readiness before release.
- Conducted onboarding sessions for incoming QA interns, promoting team knowledge-sharing and process alignment.

ACADEMIC PROJECTS

Automating Component Placements in PICs – Capstone Design Project – Roles: *Software Developer* Winter 2025

- Enhanced a LLM-generated PIC layout tool by improving routing success by from 64% to 77% using rotational algorithms, optimizing circuit compactness by achieving up to 73% size reduction and integrating I/O and DRC constraints using Python, GDSFactory and Klayout.
- Co-created a diverse testbench of 118 PIC netlists, contributing 64 circuits including experimental and industry-relevant designs for benchmarking layout quality.
- Developed scripts to automate testing and benchmarking of multiple placement algorithms across the full testbench.
- Key Achievement: Selected to receive a Certificate of Distinction for outstanding capstone project work

Too Good To Throw – Web Application Project – Roles: *QA Engineer, UX/UI Developer*

Fall 2024

- Implemented 225+ automated unit, integration, and E2E tests with a 100% pass rate using PyTest and Playwright.
- Practiced Test-Driven Development (TDD) in Django backend and React frontend to ensure robust feature delivery.
- Conducted performance testing with Locust to measure system stability under heavy traffic loads.
- Designed UI/UX assets using Canva and resolved bugs through iterative UI enhancements and shared issue tracking.
- Key Achievements: Ranked #2 out of 19 teams, voted as one of the top 3 best projects by peers and course staff.

Blood Cell Classification using CNNs & RNNs – AI Project – Roles: *ML Engineer*

Winter 2023

- Built and trained CNN-RNN-based deep learning models to classify blood cell types with 92.5% accuracy.
- Used PyTorch, NumPy, and Sklearn to implement, evaluate, and refine model performance across datasets.

The Hello World Mapper – Software Design Project – Roles: *Full Stack Developer & QA Engineer*

Winter 2022

- Built a GIS app using C++, GTK, and Glade that visualized optimization solutions for delivery routes.
- Implemented Dijkstra's and A* algorithms; reduced CPU time by 50% using multi-threading.
- Performed manual UI tests and documented their results to detect and report bugs.
